

Abstract Kadaster

Generalization: once you have done it, you know it! So you can implement it everywhere, right?

The last years Kadaster has exploited many activities in the area of automated generalization. It all started with automating the generalization of the 1:10 000 to the 1:50 000 map. For the last two years this process is fully in production.

The experiences and knowledge obtained in the generalisation of the 1:50 000 map series have been further developed to meet other challenges.

Recent projects we have done or still are working on, are; developing tools for the European Location Framework project, generalizing the 1:100 000 from 10 000, generalising the 1:10 000 map from municipal maps, and the generation of the background map with 15 different zoom levels.

Every project required a different approach and a different view, but always the same, or even more creativity. We will take you through a few projects to show you what makes each project unique, what were the challenges we faced and what we would like to see in the nearby future.
